

Do your pipes look like this?

If so, you're experiencing the damaging effects of hard water. Not sure? The signs of scale on water heaters, faucets and fixtures are tell-tell signs of larger internal problems in your plumbing system. Flow-Tech is capable of reversing this type of damage and preventing future damage.

Chemical free. Maintenance free. Easy to install. Environmentally friendly. Flow-Tech Systems.

Technology Overview

The Flow-Tech system was developed from years of research by a team of top petrochemical engineers and scientists for use in industrial applications.

The Flow-Tech system has a unique induction method that treats the entire plumbing system 24 hours a day, 7 days a week. The system induces a low frequency signal that is pulsed several thousand times per second and propagated throughout the entire plumbing system. This electromagnetic signal reverses the charge on the minerals that are dissolved in the water. This new state forces the minerals to form seed crystals that remain in suspension and are harmlessly washed away with the waste water.

Unlike other chemical and physical water treatment systems on the market, Flow-Tech has invented a proprietary means of treating all of the water throughout the plumbing system — whether the water is moving or not. With magnets, coils, and media based systems, treatment only occurs water is flowing. Any seeds that they create ultimately go back into solution when flow stops and the ability to prevent encrusting scale is lost.

About Flow-Tech

With 50 years combined experience, Flow-Tech's team of physical water treatment specialists have designed a system which increases operational efficiencies by reducing microbial contamination, potential health and safety problems, corrosion and scale deposition. Flow-Tech is the ultimate green choice.

Case Study Details

- July 2015 - December 2015
- Hotel in Austin, TX

Initial Use Case

- 6.0 Commercial Flow-Tech Anti-Scale unit was installed on the plumbing system of a national chain hotel that was experiencing the very painful realities of hard water.

Results

Before

Initial pipe inspection before installation of the Flow-Tech Anti-Scale System.

After

Pipe inspection nearly five months post installation of Flow-Tech Anti-Scale System.
